How does ICA-Req relate to other standards?
The principles and functional requirements presented in ICA-Req have been aligned with the records management principles that are set out in the International Standard on Information and documentation – Records management, ISO 15489.

A useful companion to Part 3 of ICA-Req is ISO/TR 26122, Information and documentation – Work process analysis for records. Using ISO-TR 26122 to conduct a work process analysis of activity undertaken within a business system helps identify points in a work process where a business system should be generating and capturing records.

Metadata references for the functional requirements and the metadata requirements in ICA-Req are based on ISO 23081, Information and Documentation – Managing Metadata for Records.

ICA-Req supports the Management Systems Standards for Records ISO 30300 and ISO 30301 by providing guidance to the owners and developers of records systems as to how records systems can be designed to deliver the strategic outcomes intended by overarching management systems.

What is the ICA?
The International Council on Archives is a non-governmental organisation founded in 1948. The ICA is dedicated to promoting the preservation and development of, and access to, archives across the world through international cooperation.

The ICA has a global network of more than 1400 institutional and individual members in 198 countries and territories.

Where to go for further information
For further information about the ICA or the Standard, ICA-Req visit: www.ica.org

When records are well managed, agencies can use them to assess the impact of programs, to reduce redundant efforts, to save money, and to share knowledge within and across their organizations. In these ways, proper records management is the backbone of open Government.

What is the Standard?

ICA-Req is the common name given to the Standard Principles and functional requirements for records in electronic office environments.

ICA-Req is a standard designed to harmonise and expand on existing international standards, principles and functional requirements for records management. Applying these standards to digital business systems will enable them to create and manage authentic and reliable digital records.

ICA-Req was developed by the International Council on Archives (ICA) and has been endorsed by the International Standards Organization as ISO 16175 Information and documentation – Principles and functional requirements for records in electronic office environments.

It is organised into three parts:

ISO 16175-1:2010 Overview and statement of principles
ISO 16175-2:2011 Guidelines and functional requirements for digital records management systems
ISO 16175-3:2010 Guidelines and functional requirements for records in business systems

Why do we need the Standard?

Records provide evidence of decisions, actions and transactions. For digital records to be reliable, their authenticity must be ensured by systems that maintain effective records management controls. Because of the dynamic nature of digital business systems, the capture of digital records and their on-going management can be challenging.

ICA-Req is a non-jurisdictional statement of requirements that addresses all digital records created and maintained by an organisation, in any business system, not just those in a document or record management system.

The value of ICA-Req is that it:

• assists jurisdictions that are developing or looking to adopt their own functional specifications as well as inform the update and revision of previously existing standards;
• enables the world’s archival institutions to speak to the global software market with a single voice;
• includes the expert input from stakeholders that included software vendors, governments, private sector organisations and the International Standards Organisation; and
• is principles based and therefore resonates with all organisations that manage records, irrespective of jurisdictional requirements or available resources.

How can ICA-Req help you?

Business is increasingly being conducted in digital systems and while the format of records may change, the value of records as assets of an organisation does not. Digital business systems automate activities and transactions. Evidence of activity is essential to protect organisations from risk, and enable them to meet legislative, accountability, business and community expectations.

ICA-Req recognises that organisations may want to manage records in the digital business systems that create them rather than centralising all records in one place, such as an electronic document and records management system or EDRMS.

ICA-Req provides guidance on the essential record-specific functionality needed to achieve both good business and good recordkeeping outcomes within a single digital system. Using the Standard to understand essential record-specific functionality will help in conversations with vendors on any business system.

Creating and managing reliable digital records ensures that information remains accessible and reliable over time. Effective records management improves efficiency and ensures that an organisation’s information of administrative, legal or fiscal value, is protected.
